

## **BRAGBOARD**

### **PROJECT WEEK 4 REPORT:-**

**NAME : CHITIRALA GIRIDHAR**

**GMAIL: [GIRIDHARCHITIRALA@GMAIL.COM](mailto:GIRIDHARCHITIRALA@GMAIL.COM)**

**GITHUB LINK:- <https://github.com/springboardmentorx5768/Project-2.git>**

### **Week 4 – Shout-Out Feed:-**

#### **Goal:**

Enable users to view all shout-outs, filter them by department, sender, and date, and optionally attach images or files.

#### **Backend (FastAPI)**

##### **1. Data Model**

```
class ShoutOut(BaseModel):
```

```
    id: int
```

```
    sender: str
```

```
    department: str
```

```
    message: str
```

```
    date: datetime
```

```
    image_url: Optional[str]
```

- sender: Name of the person giving the shout-out
- department: Team or department name
- message: Appreciation content
- date: Timestamp of shout-out
- image\_url: Optional path to uploaded image

## 2. API Endpoints

### a. GET /shoutouts

Returns all shout-outs or filtered results.

```
@app.get("/shoutouts")

def get_shoutouts(department: str = None, sender: str = None, date: str = None):

    query = db.query(ShoutOut)

    if department:

        query = query.filter(ShoutOut.department == department)

    if sender:

        query = query.filter(ShoutOut.sender == sender)

    if date:

        query = query.filter(ShoutOut.date == date)

    return query.all()
```

### b. POST /shoutouts

Accepts new shout-out with optional image.

```
@app.post("/shoutouts")

async def create_shoutout(sender: str, department: str, message: str, date: str, image:
UploadFile = File(None)):

    image_url = None

    if image:

        contents = await image.read()

        with open(f'images/{image.filename}', "wb") as f:

            f.write(contents)

        image_url = f'/images/{image.filename}'

    shoutout = ShoutOut(sender=sender, department=department, message=message,
date=date, image_url=image_url)

    db.add(shoutout)

    db.commit()

    return {"status": "success"}
```

## Frontend (React)

### 1. Display All Shout-Outs

```
useEffect(() => {  
  fetch('/shoutouts')  
    .then(res => res.json())  
    .then(data => setShoutouts(data));  
}, []);
```

### 2. Filtering UI

```
const handleFilter = () => {  
  fetch(`/shoutouts?department=${dep}&sender=${sender}&date=${date}`)  
    .then(res => res.json())  
    .then(data => setShoutouts(data));  
};
```

- dep, sender, date are state variables from dropdowns or inputs.

### 3. Image Upload (Optional)

```
const handleUpload = (e) => {  
  const formData = new FormData();  
  formData.append('sender', sender);  
  formData.append('department', department);  
  formData.append('message', message);  
  formData.append('date', date);  
  formData.append('image', e.target.files[0]);  
  fetch('/shoutouts', {  
    method: 'POST',  
    body: formData  
  });  
};
```

## Common Errors & Debugging

| Error                      | Cause                                     | Fix                                       |
|----------------------------|-------------------------------------------|-------------------------------------------|
| 415 Unsupported Media Type | Image not sent as multipart/form-data     | Use FormData in frontend                  |
| null image_url             | Backend not saving image path             | Ensure image is written and URL returned  |
| Filter returns empty       | Query mismatch or wrong format            | Validate frontend query parameters        |
| Date mismatch              | Format error between frontend and backend | Use ISO format (YYYY-MM-DD)               |
| Image not previewing       | Missing frontend preview logic            | Use URL.createObjectURL(file) for preview |

---

## Sample JSON Structure

```
{  
  "id": 101,  
  "sender": "Cheethirala",  
  "department": "AI & VLSI",  
  "message": "Great job on the Week 3 module!",  
  "date": "2025-10-25",  
  "image_url": "/images/week3.png"  
}
```

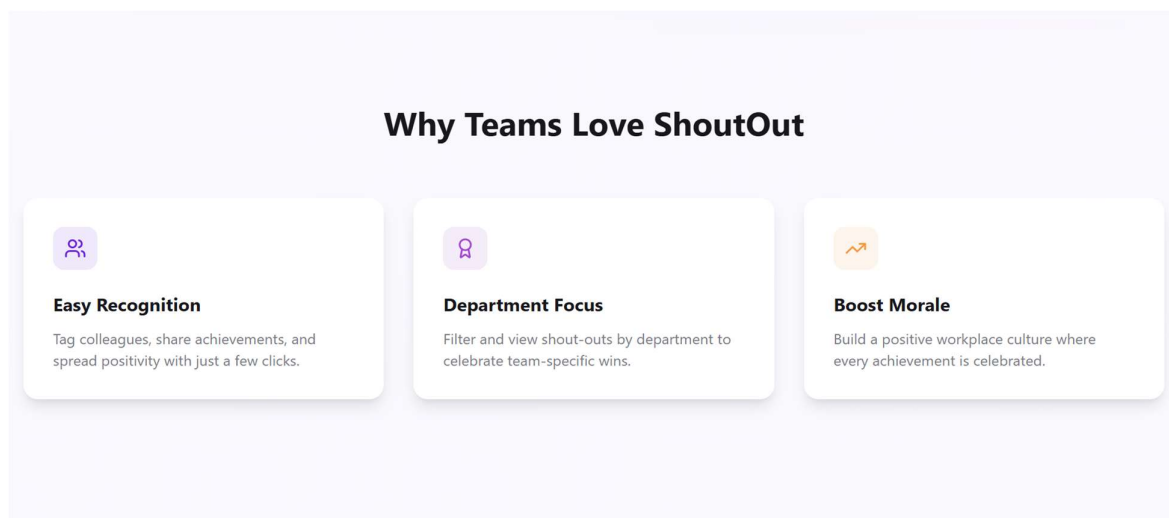

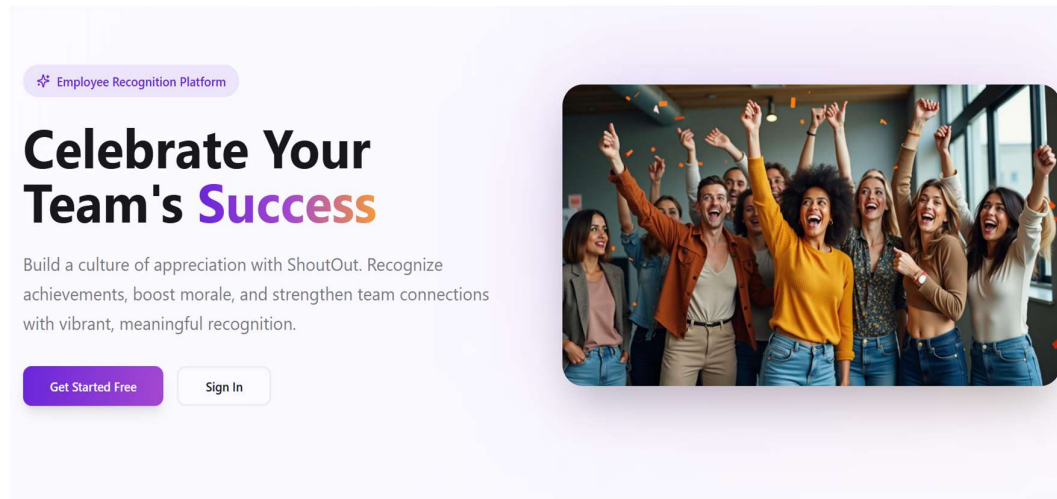

---

## Flow Summary

1. **User opens feed** → All shout-outs fetched via GET /shoutouts
2. **User applies filters** → Query params sent to backend
3. **User uploads image** → Sent via POST /shoutouts with FormData
4. **Backend saves image** → Returns image URL

5. **Frontend displays image** → Uses `img src={image_url}`
