

Project Name: Brag Board

Project Title: Implementing a Commenting System with User Identity & Timestamps

Submitted by: *Battula Sruthi Keerthi*

Under the Guidance of: *Respected Madhuri Mam*

Task Objectives

1. Add a commenting system under each shout-out post.
 2. Display user avatars, names, and timestamps.
 3. Support nested replies (optional).
 4. Implement basic moderation such as deleting or editing comments.
-

What I Did

This task focused on creating interactive communication through comments.

Frontend Work

- Developed a **comment input box** with auto-update.
- Displayed comments with:
 - Username
 - Avatar
 - Time posted
- Created a clean comment list UI.
- Added optional nested replies for threaded conversations.

Backend Work

- Built API endpoints for adding, editing, deleting, and fetching comments.
- Designed database tables to store comment structure.
- Implemented comment threading logic.

Integration

- Connected React components to FastAPI comment routes.
 - Ensured comments load in real-time without page reload.
-

What I Learned

- Implementing **CRUD operations** for user-generated content.
 - Displaying hierarchical (nested) data in the UI.
 - Moderation workflows and safe content handling.
-

Outcome

Users can now comment under any shout-out, reply to others, and view comment details with timestamps.

Challenges Faced

- Handling nested comment rendering.
 - Managing comment update states correctly.
 - Ensuring consistency between frontend lists and backend data.
-

Reflection

This task improved my experience with dynamic lists, hierarchical UI design, and backend content moderation.

Acknowledgment

I thank **Madhuri Mam** for guiding me in implementing complex user interaction features.
